

## What Are Webhooks?

Webhooks is a method for retrieving data from StorLogix Cloud for PTI's enterprise customers looking to integrate PTI event data into their third-party software.

### What is Needed?

Since PTI intended Webhooks for enterprise customers, they will need to set up a data repository (Server) with a URL to give PTI a location to send the data.

### How is the data transfer triggered?

When a preset event occurs at the self-storage site, StorLogix Cloud sends data on the event to the URL entered in the Webhooks configuration.

A Company's IT Department needs to configure Webhooks and Backend Materials.
